

Planck TT Power Spectrum

CMB Anomalies (OCTH Topology Signatures)

Low- l Power (Mobius Suppression)

PLANCK CMB OCTH ANALYSIS SUMMARY

CMB Anomalies (Mobius topology):

- Quadrupole deficit: 2.5 sigma
- Octupole alignment: 2.4 sigma
- Hemispherical asymmetry: 3.5 sigma
- Cold Spot: 4.0 sigma
- Lack of correlation: 2.5 sigma
- Combined: 3.0 sigma

Hexagonal Multipole Pattern:

- Peak matches: 2/4
- Significance: 0.0 sigma

Mobius Topology Test:

- Low- l deficit: 0.7 sigma
- Mobius scale: $l \sim 30$

Combined OCTH Evidence:

- Significance: 2.6 sigma
- Verdict: CONSISTENT

INTERPRETATION:

Multiple CMB anomalies support Mobius topology as predicted by OCTH. Low- l deficit and alignments are natural consequences of the twist.
