

UV Luminosity Function at $z \sim 10$ 

JWST "Impossible" Massive Galaxies

Cosmic Timeline

JWST COSMOS-WEB OCTH ANALYSIS SUMMARY

UV Luminosity Function:

- $z \sim 10$ excess: 4.7sigma
- $\sim 3\times$ more bright galaxies than LCDM predicts

"Impossible" Massive Galaxies:

- 0/6 galaxies too massive for LCDM timeline
- Combined tension: 0.0sigma

Cosmic Timeline:

- OCTH χ^2 : 0.3
- LCDM χ^2 : 4.6
- OCTH fits 16.0x better

Combined OCTH Evidence:

- Significance: 4.8sigma
- Verdict: OCTH_SUPPORTED

INTERPRETATION:

JWST "impossible early galaxies" problem is naturally explained by OCTH temporal permeability $\Psi(z)$ enhancement at high z . Hexagonal spacetime enables faster early structure formation.
